

# Well-child check-ups

## Keep this checklist of important well-child visits handy.

Regular well-child visits check your child's growth and development, and can help you stay on track with recommended immunizations.

A first visit to the dentist is recommended by a baby's first birthday, or when teeth first arrive.

Well-child visits are a good time to ask your child's provider about sleep, growth, nutrition, behavior, medication and learning milestones.

### Babies

(less than one year)

#### See the doctor:

- 3-5 days
- 1mo
- 2mo
- 4mo
- 6mo
- 9mo

#### Visit focus:

### Pre-teens and teens

(ages 11 and up)

#### See the doctor:

- Once a year

#### Visit focus:

- Blood pressure and Cardiac screening
- Depression screening (age 12 and older)
- Hearing screenings (age 11-14 once, age 15-18 once, age 18-21 once)
- Oral health check\*
- Obesity screening - measure body mass index (BMI)
- Vision screenings (age 15)\*
- Developmental/Behavioral/Emotional screening
- Vaccinations
- Lipid screening
- Substance use screening

## Does your plan include additional dental, vision and hearing coverage?

\*Many plans offered by **Univera Healthcare** also include coverage for routine dental care, eye exams, glasses or contacts, hearing screenings and/or hearing aids. Log in to [UniveraHealthcare.com](https://www.univerahealthcare.com) to check your benefits and coverage. Our Customer Care advocates are also happy to help.

First dental visit is recommended by a baby's first birthday, or when teeth first arrive.

### Schedule

Make your next appointment while you are at provider's office. It is always easier to schedule ahead!

### School, daycare or camp forms

Bring these forms with you if they need to be signed by a doctor. Ask if you need a copy of your annual physical and/or immunization records.

Right here. For you.

# Why screenings and vaccines are important

## Autism screening

Typically performed during a well-child visit, your doctor will assess your child's behavior for any early signs of developmental challenges.

## Cardiac screening

High blood pressure and high cholesterol do not just affect adults. Like most conditions, if its identified early it is easier to treat.

## Depression screening

Depression is a serious mental health issue that often goes undetected among adolescents and can affect virtually every aspect of life.

## Developmental screening

Developmental surveillance occurs at every health visit. Children are screened regularly for risk of developmental, behavioral, and social delays using a standardized screening tools.

## Hearing screening

All babies receive a hearing screening in the hospital. Early screenings can help prevent delays in speech and language development caused by hearing problems.

## Vaccines

Your child's need for immunizations should be evaluated at every well child visit. From whooping cough and rotavirus to measles and the flu, vaccines are a safe and effective way to protect your child from a wide range of potentially serious diseases.

## Lead screening

Too much lead in the blood of small children can result in serious developmental issues.

## Obesity screening and counseling

A Body Mass Index (BMI) measurement is calculated using your child's height and weight. Your doctor may discuss how to help your child develop healthy habits through nutrition and exercise.

## Oral health risk assessment

Your doctor can determine if your child is at a high risk of tooth decay and/or oral disease and refer you to a dentist early if necessary. A first appointment with a dentist is recommended by a baby's first birthday, or when first teeth arrive. After this dentists often recommend a visit every six months.

## Vision screening

Even if your child doesn't show any symptoms of vision problems, regular checkups are essential. Vision problems left unchecked can impact learning and sports performance.
