MEDICAL POLICY DETAILS	
Medical Policy Title	**Extracorporeal Photochemotherapy/Photopheresis**
Policy Number	**8.01.01**
Category	**Technology Assessment**
Original Effective Date	**10/18/01**
Committee Approval Date	**01/17/02, 11/21/02, 10/15/03, 08/19/04, 06/16/05, 04/20/06, 02/15/07, 02/21/08, 01/15/09, 12/17/09, 01/20/11, 12/15/11, 12/20/12, 12/19/13, 11/20/14, 10/15/15, 10/20/16, 10/19/17**
Current Effective Date	**10/19/23**
Archived Date	**11/15/18**
Archive Review Date	**11/21/19, 11/19/20, 11/18/21, 11/17/22, 10/19/23**
Product Disclaimer	• *If a product excludes coverage for a service, it is not covered, and medical policy criteria do not apply.* • *If a commercial product (including an Essential Plan or Child Health Plus product), medical policy criteria apply to the benefit.* • *If a Medicaid product covers a specific service, and there are no New York State Medicaid guidelines (eMedNY) criteria, medical policy criteria apply to the benefit.* • *If a Medicare product (including Medicare HMO-Dual Special Needs Program (DSNP) product) covers a specific service, and there is no national or local Medicare coverage decision for the service, medical policy criteria apply to the benefit.* • *If a Medicare HMO-Dual Special Needs Program (DSNP) product DOES NOT cover a specific service, please refer to the Medicaid Product coverage line.*

POLICY STATEMENT

I. Based upon our criteria and assessment of the peer-reviewed literature, extracorporeal photochemotherapy (ECP), or photopheresis, has been medically proven to be effective and, therefore, is considered **medically appropriate** for the following indications:
   A. Palliative treatment of the skin manifestations of cutaneous T-cell lymphoma (also called mycosis fungoides) or Sézary syndrome that have not responded to other therapy; or
   B. Acute and chronic extensive graft-versus-host disease (GVHD) that is refractory to conventional therapy; or
   C. Cardiac allograft rejection that is recurrent or refractory to immunosuppressive treatment.

II. Based upon our criteria and assessment of the peer-reviewed literature, the use of ECP (photopheresis) has not been medically proven to be effective and, therefore, is considered **investigational** for all other indications, including, but not limited to, the treatment of:
   A. Acute or chronic GVHD in previously untreated patients or those responding to conventional therapy;
   B. Lyme disease;
   C. Scleroderma (a.k.a. progressive systemic sclerosis (PSS), systemic sclerosis (SS), dermatosclerosis, or CREST syndrome);
   D. Autoimmune diseases (e.g., pemphigus vulgaris, pemphigus foliaceus, psoriatic arthritis, rheumatoid arthritis, systemic lupus erythematosus, severe atopic dermatitis);
   E. Crohn's disease;
   F. Allograft rejections of solid organs other than the heart; or
   G. Diabetes Mellitus.

Refer to Corporate Medical Policy #11.01.03 Experimental and Investigational Services

POLICY GUIDELINES

The U.S. Food and Drug Administration (FDA) has approved, via premarket application, two photopheresis systems manufactured by Therakos, Inc. (West Chester, PA). Both systems are approved for use in ultraviolet A (UVA) irradiation treatment, in the presence of the photoactive drug 8-methoxypsoralen (8-MOP), of extracorporeally circulating leukocyte-enriched blood, in the palliative treatment of skin manifestations of cutaneous T-cell lymphoma (CTCL), in persons who have not been responsive to other forms of treatment. The two systems are: the UVAR XTS Photopheresis System, FDA-approved in 1987, and CELLEX, FDA-approved in 2009. Treatment of GVHD is considered an off-label use of the device. Therefore, the use for treatment of autoimmune disease is considered off-label use.

DESCRIPTION

ECP, or photopheresis, is an immune-modulating therapy technique used in the treatment of certain skin disorders. It involves an oral intake of 8-methoxypsoralen (8-MOP) and cytopheresis, or addition of 8-MOP to the cells after removal, followed by ultraviolet actinotherapy (UVA) irradiation and reinfusion of leukocytes into the patient.

RATIONALE

Long-term follow-up data demonstrate that ECP provides significant disease remission and prolongation of life in patients with cutaneous T-cell lymphoma and Sézary syndrome. A range of 50-83% of patients with CTCL demonstrated clinical cutaneous improvements, with 18-25% showing a complete response. The long-term follow-up of patients with Sézary syndrome shows an average survival time of greater than 100 months, compared to survival times of 30 to 40 months for patients treated with other therapies.

Evidence supporting the use of ECP for the treatment of GVHD relates to both acute GVHD (aGVHD) and chronic GVHD (cGVHD) in pediatric and adult populations. The published literature lacks randomized trials. Evidence comprises retrospective reviews and non-randomized comparisons. The data consistently show improvement in GVHD that is unresponsive to standard therapy. Additionally, there is a lack of other treatment options for these patients, and this option has the added benefit of minimal side effects from ECP, as well as the possibility of reduction and often cessation of treatment with corticosteroids and other immunosuppressive agents, if there is a response to ECP. For patients with untreated disease or those who are showing improvement on standard therapy, there is no data to support the use of ECP.

Scleroderma is the most studied of the autoimmune diseases utilizing photopheresis, but the efficacy of photopheresis for these diseases, as yet, has not been demonstrated in well-designed clinical trials.

Photopheresis alone, or in combination with immunosuppressive therapy is also being investigated in the treatment of solid organ transplant rejection. While ECP has been utilized for prevention of cardiac allograft rejection and acute rejection, the strongest evidence in cardiac transplant patients revolves around its use for recurrent and refractory allograft rejection. While the evidence consists of non-randomized studies, the outcomes from these studies provide consistent evidence of the beneficial effect of ECP for cardiac transplant patients with rejection refractory to standard therapy. There is insufficient evidence to support the use of ECP for graft rejection in other solid organs, such as lung, liver, and kidney. Though preliminary results are promising, additional studies with longer follow-up are needed, to evaluate the ultimate effect of photopheresis on patient survival.

CODES

- *Eligibility for reimbursement is based upon the benefits set forth in the member's subscriber contract.*
- *CODES MAY NOT BE COVERED UNDER ALL CIRCUMSTANCES. PLEASE READ THE POLICY AND GUIDELINES STATEMENTS CAREFULLY.*
- *Codes may not be all inclusive as the AMA and CMS code updates may occur more frequently than policy updates.*
- *Code Key: Experimental/Investigational = (E/I), Not medically necessary/ appropriate = (NMN).*

CPT Codes

Code	Description
